Programme summary	5
Support sheet S1 : Summary diagram for the diagnosis of the farm (Step 1a)	6
Support sheet S2 : Description of the current CS (Step 1b)	7
Support sheet S3 : Evaluation of the current CS (Step 1c)	8
Support sheet S4 : Introduction of alternative solutions available for integrated crop management at the rotation scale (Step 2a)	9
Support sheet S5 : Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)	11
Support sheet S6 : Evaluation of alternative CS (Step 3)	17

List of abbreviations

The forms in this list are marked by the ^a sign in the text.

CMP	Crop management plan
COMIFER	Comité Français pour le développement de la Fertilisation Raisonnée (French committee for the development of rationalised fertilisation)
CS	Cropping system
CT	Conservation tillage
F	Farm
IC	Intercrop period
K	Potassium
N	Nitrogen
OM	Organic matter
P	Phosphorous
RSA	Revue Suisse Agricole (Swiss Journal of Agriculture)
TFI	Treatment Frequency Index

Programme summary

Step 1: Diagnosis of the initial situation
1.a. Overall performance of the farm
Objectives : → Understanding the overall objectives of the farmer for his farm → Understanding the farm's assets and constraints → Identifying the CS ^a of the farm and which should be improved first <i>Production of a diagnosis of the farm (Support sheet S1)</i>
1.b. Description of the cropping system to be improved
Objectives : → Characterise the CS ^a (crop sequence, CMPs ^a) and soil types → Become acquainted with the farmer's objectives and issues with the CS ^a <i>Description of the crop sequence</i> <i>Description of the CMPs^a (Calculator - see Support sheet S2 for example)</i>
1.c. Evaluation of the initial cropping system
Objectives : → Evaluate the CS ^a , starting with predefined indicators to then be able to compare its performance with those of the proposed alternative systems <i>Multicriteria evaluation of the current CS (Calculator - see Support sheet S3 for example)</i>
Step 2: Co-design of alternative cropping systems
Objectives : → Identify with the farmer those agronomic levers already used in the current CS ^a at the rotation scale → Identify supplementary levers which could be interesting to use, according to the objectives
2.a. Considering the rotation
<i>Identify those levers used at the rotation scale in the current CS^a</i> <i>Suggest supplementary levers for implementation (Support sheet S4)</i>
2.b. Considering the CMP
<i>Identification of levers for implementation at the CMP scale in the current CS^a</i> <i>Suggest supplementary levers for implementation (Support sheet S5)</i> <i>Description of the CMP^a for the CS^a constructed (Calculator - see Support sheet S2 for example)</i>
Step 3: Evaluating alternative cropping systems compared with the initial cropping system
Objectives : → Evaluate the performances of alternative CS ^a compared with the initial CS ^a <i>Multicriteria and qualitative evaluation of the performances of the CS^a constructed (Calculator - see Support sheet S6 for example)</i>
Step 4: Discussion of results
Objectives : → Discuss the introduction of alternative systems suggested for the farm

Support sheet S1 :

Summary diagram for the diagnosis of the farm (Step 1a)

Date :	Farm :								
Priority tasks	Farmer's priorities	Milieu (soil/climate)							
Workforce	<table border="1"> <thead> <tr> <th colspan="2">Crop sequences</th> </tr> </thead> <tbody> <tr> <td> Crop sequence 1 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing </td> <td> Crop sequence 2 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing </td> </tr> <tr> <td> Crop sequence 3 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing </td> <td> Crop sequence 4 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing </td> </tr> </tbody> </table>		Crop sequences		Crop sequence 1 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing	Crop sequence 2 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing	Crop sequence 3 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing	Crop sequence 4 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing	Local issues
Crop sequences									
Crop sequence 1 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing	Crop sequence 2 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing								
Crop sequence 3 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing	Crop sequence 4 % on F: Crops: Most common planting method: ploughing/SCT/direct sowing								
Equipment/material		Crop enemies							
Location of fields	Production system	Technical-economic environment							

(According to Capillon, Vogrincic et al.)
 The diagram should be completed by highlighting the assets and constraints of the farm for each of the criteria above. A list of questions is supplied in Help sheet H1 for completing the table.

Support sheet S2 :

Description of the current CS (Step 1b)

For this programme the identification of practices is made directly in the calculator.

An example of the relevant sheet for practices is presented below, showing how it should be completed.

Légende (type d'information) :
■ Information requise
■ Information facultative
■ Information complétée

Nom du système de culture :

Contexte de prix d'achat des fertilisants :
 Contexte de prix de vente de la récolte :

Année 1 : Colza d'hiver
 Année 2 : Blé tendre d'hiver
 Année 3 : Orge d'hiver

MODE DE GESTION DE L'INTERCULTURE PRÉCÉDENTE :

Post-moisson :
 Broyage ou rebroyage des pailles chaumées : Oui Non Non
Implantation éventuelle d'une culture intermédiaire (ou repousses) :
 Culture intermédiaire semée (ou repousses) : Sol nu Sol nu Sol nu
 Matériel utilisé : sans objet sans objet sans objet
 Mode de destruction de la culture intermédiaire : sans objet sans objet sans objet

Préparation du semis de la culture :
 Désherbage chimique en interculture : IFT : 1.0 0.0 0.0
 Nombre de passages : 1.0 0.0 0.0
 Charges : (€/ha) 10.0 0.0 0.0
 Travaux du sol entre récolte du précédent et semis de la culture : Labour : Oui Oui Oui
 Travaux superficiels (-15cm de profondeur) : bre pass.) 0 2 2
 Décompactage : Non Non Non
 Roulage (mettre non si semis en combiné) : Non Non Non

SEMIS DE LA CULTURE PRINCIPALE :
 Date de semis : Moyenne Moyenne Moyenne
 Espèce semée : Colza d'hiver Blé tendre d'hiver Orge d'hiver
 Matériel utilisé : Semoir céréales Semoir céréales Semoir céréales
 Nombre de variétés semées : 1 1 1
 Densité de semis (normale) : 40 gr/m2 250 gr/m2 180 gr/m2
 Ecartement des rangs : (cm) 17 17 17
 Traitement des semences : Oui Oui Oui

FERTILISATION :

Fertilisation minérale :
 Quantité d'azote minéral apportée : (kg d'N/ha) 170.0 180.0 140.0
 Nombre d'apports : 2.0 3.0 2.0

Fertilisation organique :
 Quantité totale d'azote organique apportée : (kg d'N/ha) 0.0 0.0 0.0
 Nombre d'apports de fumier : 0.0 0.0 0.0
 Nombre d'apports de lisier : 0.0 0.0 0.0
 Coût de la fertilisation organique : (€/ha) 0.0 0.0 0.0

PROTECTION DES CULTURES :

Lutte chimique :

Herbicides : IFT : 2.2 1.8 1.5
 Nombre de passages : 3.0 2.0 2.0
 Charges : 88.0 88.2 67.5

Insecticides : IFT : 3.0 1.0 0.5
 Nombre de passages : 3.0 1.0 0.5
 Charges : (€/ha) 42.0 9.0 4.5

Fongicides : IFT : 1.0 1.6 1.5
 Nombre de passages : 1.0 2.0 2.0
 Charges : (€/ha) 45.0 60.8 60.0

Autres (molluscicides, régulateurs,...) : IFT : 0.6 1.0 0.7
 Nombre de passages : 1.0 1.0 1.5
 Charges : (€/ha) 15.0 13.0 14.0

Lutte mécanique : Bineuse : (nbre passage) 0.0 0.0 0.0
 Herse étrille : (nbre passage) 0.0 0.0 0.0
 Houe rotative : (nbre passage) 0.0 0.0 0.0

Lutte biologique : Moyen de lutte : Aucun Aucun Aucun

IRRIGATION :
 Quantité d'eau apportée : (m3/ha) 0 0 0

RÉCOLTE CULTURE EN GRAIN :
 Matériel utilisé : Moissonneuse batteuse Moissonneuse batteuse Moissonneuse batteuse
 Exportation pailles/fanes : Non Non Non
 Rendement : (T/ha) 3.5 8.0 7.2

RÉCOLTE CULTURE FOURRAGÈRE ANNUELLE/PLURIANNUELLE :
 Nombre de passages pour foin :
 Nombre de passages pour ensilage :
 Rendement : (T MS/ha)

OBSERVATIONS :

Support sheet S3 : Evaluation of the current CS (Step 1c)

The evaluation for this programme is made with the help of the calculator. Below is an example of the results obtained.

Système de culture de référence :

Nom	Référence	Cultures
CBO	Oui	Colza d'hiver -> Blé tendre d'hiver -> Orge d'hiver

Systèmes de culture alternatifs :

Ces flèches permettent de déplacer le système de culture sélectionné

Nom	Référence	Cultures
CBLBPB	Non	Colza d'hiver -> Blé tendre d'hiver -> Lin graine -> Blé tendr...

Résultats de l'évaluation :

Evaluer les systèmes de culture

Pour les indicateurs surlignés en rouge :

Des paramètres rentrés par l'utilisateur ont été utilisés.
Le résultat obtenu n'est pas garanti

Comparaisons des systèmes de culture		CBO(Moyen/Moyen)	CBLBPB(Moyen/Moyen)

Nombre de passages : Pulvérisation		7	4,7 (- 33 %)
Nombre de passages : travaux méca...		2,3	3,3 (+ 43 %)
Temps de passage	h/ha	4,8	5,3 (+ 10,2 %)
Temps de passage : Pulvérisation	h/ha	0,9	0,6 (- 33,3 %)
Temps de passage : travaux méca...	h/ha	2,2	2,6 (+ 19,7 %)

Support sheet S4 :

Introduction of alternative solutions available for integrated crop management at the rotation scale (Step 2a)

To complete this table, refer to help sheet H3 for the characteristics of arable crops.

The objective of this table is to make it possible to rapidly see which practices have already been implemented by the farmer and those which could be used in alternative CS^a. In no case is the objective to introduce all these levers in the CS^a: according to the objectives and the constraints of the farmer, the task is to find a combination of practices to limit the pest pressure he is faced with.

Date :

Farm :

Targets in the pest cycle	Technical solutions available	Indicators	Implementation by the farmer								
			Implementation in current CS		Implementation in alternative CS 1		Implementation in alternative CS 2				
			Rotation :		Rotation :		Rotation :				
			Probably yes	Probably no	Probably yes	Probably no	Probably yes	Probably no			
Limit the presence of pests in general in the crops	Diversify families and species in the rotation to break the pest cycle, taking into account the time period before the return of crops and the possible precedents	Absence of precedents to be avoided									
Limit the presence of diseases in the crops	Diversify families and species in the rotation to break the pest cycle, taking into account the time period before the return of crops and the possible precedents	At least two different families									
		At least three different species cultivated									
		Respect for time period between same crop									
Limit the specialisation of weed flora and reduce the seed bank	Diversify families and species in the rotation for 'despecialising' weed flora	At least three sowing periods in four									
		Ratio of autumn crops to spring crops close to 2/3									
Reduce the population of animal pests in the field	Introduce a long fallow period one year in three to allow tillage	At least one long fallow period every three years									
Add nitrogen to the system	Introduce at least one leguminous crop into the rotation	At least ¼ of leguminous crop in the rotation									
Maintain level of OM in the soil	Sowing a grain crop returning straw at least one year in three	At least one grain crop returning straw every three years									
Trap nitrogen in the soil in winter period	Follow a leguminous crop by a winter crop with high N demand or, as a default, a cover crop	A leguminous crop followed by a winter crop with high N demand									
Maintain chemical fertility of soil	Alternate crops with high PK demand with less demanding crops	Less than 30% of crops with high P demand									
		Less than 30% of crops with high K demand									

 Strategies concerned with crop protection

Support sheet S4 :

Introduction of alternative solutions available for integrated crop management at the rotation scale (Step 2a)

Remark :

The interactions which would take place during the introduction of these practices are not taken into account here.

The effects of implementing these strategies on a given system depend on the soil and weather conditions in which the system is situated. Thus, the contribution of straw to the level of organic matter in the soil depends on the climate; in hot and wet climates, mineralisation of organic matter occurs faster.

Finally, it is important to consider tillage at the same time as the crop sequence. Indeed, the interaction between these two elements has an important role in the management of pests.

Support sheet S5 :

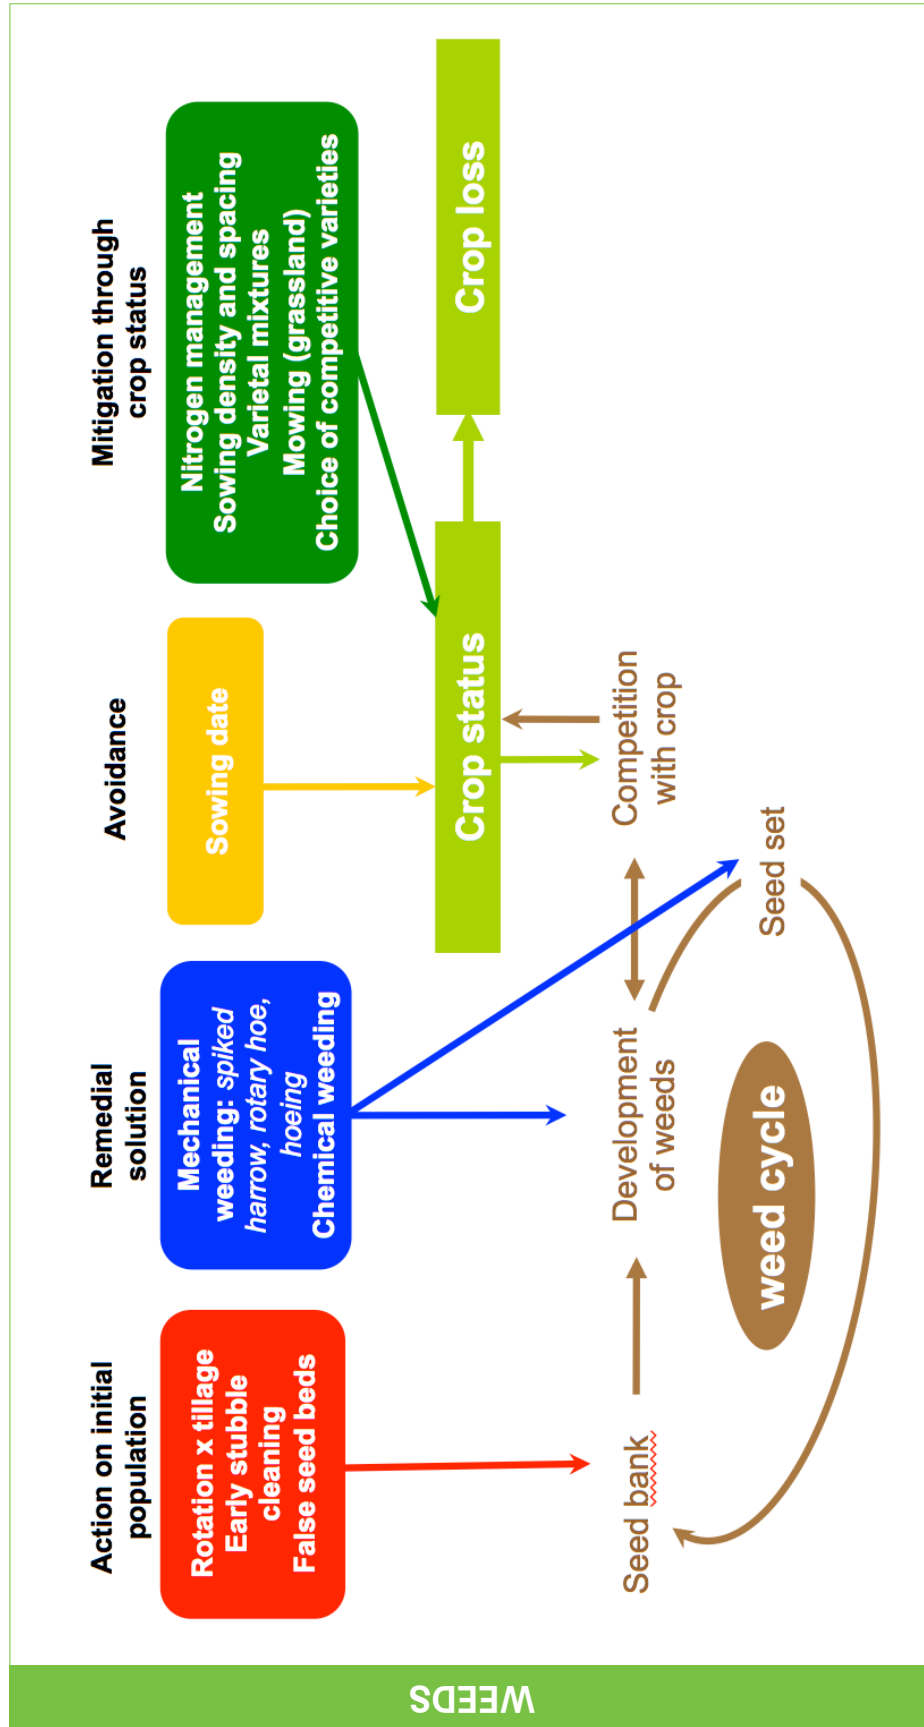

Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)

Farm :

Date :

The objective of this table is to make it possible to rapidly see which practices have already been implemented by the farmer and those which could be used in alternative CSA. In no case is the objective to introduce all these levers in the CSA: according to the objectives and the constraints of the farmer, the task is to find a combination of practices to limit the pest pressure he is faced with.

Interactions between practices, crop status and pest cycle for weeds

TO BE COPIED SEVERAL TIMES FOR USE IN THE IMPLEMENTATION OF THE PROGRAMME

Support sheet S5 :

Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)

		Technical solutions available	Implementation in current CS		Implementation in alternative CS 1		Implementation in alternative CS2					
			Probably yes	Probably no	Probably yes	Probably no	Probably yes	Probably no				
Limit observed injury	Objectives	<p>Diversification of the crop rotation (alternating sowing periods and growing methods, introduction of cover crops)</p> <p>Tillage (stubble cleaning, ploughing etc.) – in conjunction with the crop rotation – to bury seeds</p> <p>Stale seed beds: to germinate weeds</p> <p>Tillage (stubble-cleaning, ploughing etc.)</p> <p>Stale seed beds</p> <p>Mechanical weeding</p> <p>Use of cover crops</p> <p>Limiting contamination by equipment</p> <p>Shifting sowing date</p>										
			Reduce seed bank – break weed cycle									
			Destroy weeds									
			Avoiding external contamination									
			Limit the periods when the plant is in competition with the weed									
			Limit crop loss	Objectives	<p>Adjustment of nitrogen inputs to the production needs of the crop to encourage its development</p> <p>Shifting sowing date</p> <p>Increase sowing density, reduce spacing between rows</p> <p>Combination of species and varieties</p> <p>Choice of competitive varieties (according to their phenological characteristics)</p>							
						Make the crop canopy competitive with weeds						

A. WEEDS

Support sheet S5 :

Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)

Interactions between practices, crop status and pest cycle for pathogens responsible for diseases

TO BE COPIED SEVERAL TIMES FOR USE IN THE IMPLEMENTATION OF THE PROGRAMME

Support sheet S5 :

Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)

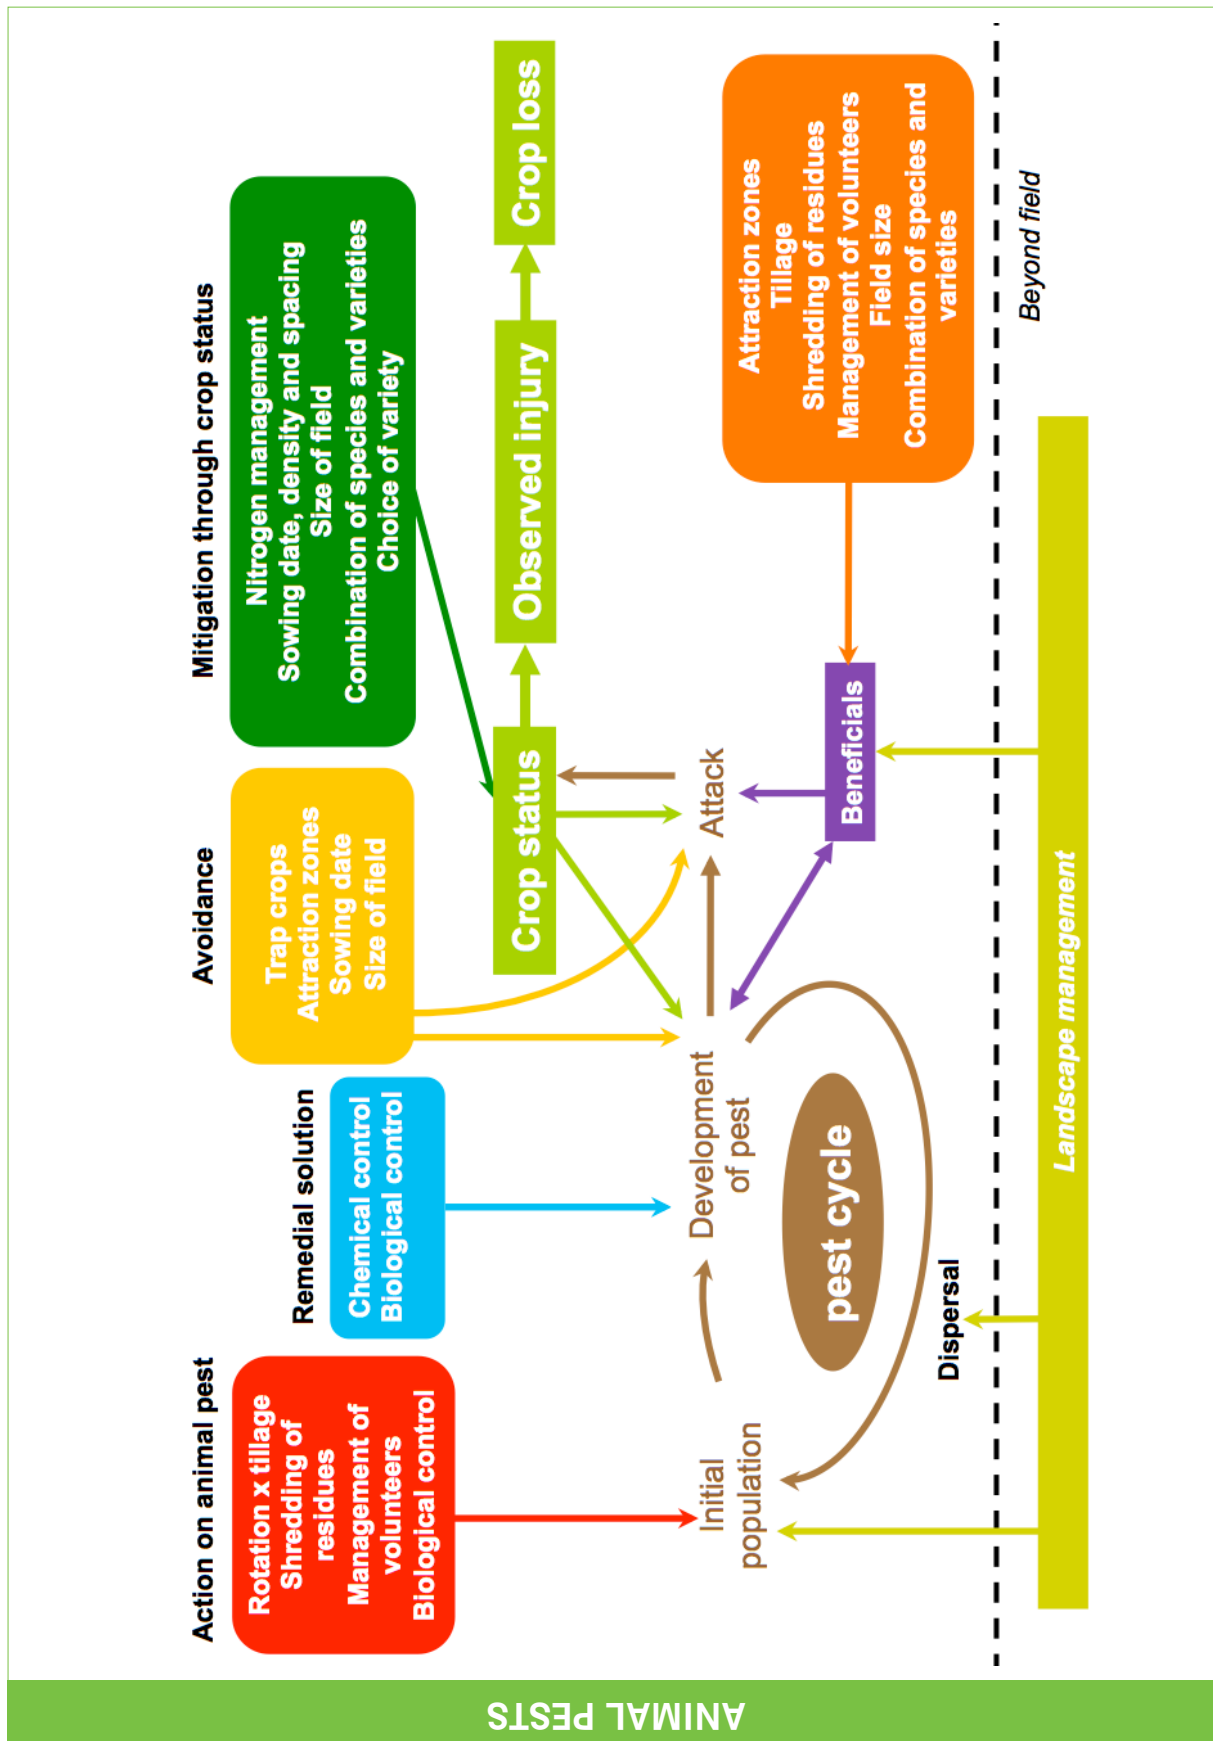

A. DISEASES

Objectives	Technical solutions available	Implementation in current CS		Implementation in alternative CS1		Implementation in alternative CS2		
		Probably yes	Probably no	Probably yes	Probably no	Probably yes	Probably no	
Limit observed injury	<p>Diversification of the rotation (diversification of crops, respect for recommended times before return of crop) => for soil-borne diseases</p> <p>Tillage to bury crop residues – in conjunction with rotation => for diseases which can survive on residues</p> <p>Shredding of crop residues => for diseases which can survive on residues</p> <p>Destruction of volunteers and host weeds => for diseases which can survive only on living plants</p> <p>Biological control</p> <p>Choice of uncontaminated seed</p> <p>Limiting contamination by equipment</p> <p><i>Limiting dispersion between fields through landscape management</i></p> <p>Adjustment of nitrogen inputs to the production needs of the crop to limit over-development of foliar surfaces</p> <p>Reduction of sowing density</p> <p>Combination of species and varieties</p> <p>Reduction of sowing density</p> <p>Choice of resistant varieties</p> <p>Combination of varieties</p> <p>Combination of species and varieties</p> <p>Choice of resistant varieties</p> <p>Shifting sowing date</p>							
		Reduce source of inoculum – break the disease cycle						
		Avoiding external contamination						
		Limit contact surfaces between target crop and pest						
		Limit dispersion of the disease within the field						
		Create a microclimate unfavourable for disease development						
		Boost resistance of canopy to diseases						
		Ensure the durability of resistance						
		Increase the tolerance of the canopy to diseases						
		Limit periods when plant is in contact with pest in contamination phase and thus vulnerable						
		Limit crop loss						

Support sheet S5 :

Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)

Interactions between practices, crop status and pest cycle for animal pests

TO BE COPIED SEVERAL TIMES FOR USE IN THE IMPLEMENTATION OF THE PROGRAMME

Support sheet S5 :

Mechanisms and introduction of alternative technical solutions available for crop protection at the CMP scale (Step 2b)

A. ANIMAL PESTS

Objectives	Technical solutions available	Implementation in current CS		Implementation in alternative CS 1		Implementation in alternative CS2		
		Probably yes	Probably no	Probably yes	Probably no	Probably yes	Probably no	
Limit observed injury	Break the cycle of soil-borne pests (for example, nematodes)	Diversification of the rotation (alternating host and non-host crops)						
		Shredding of crop residues						
	Tillage in conjunction with rotation							
	Destruction of volunteers and weed hosts							
	Biological control							
	Encourage beneficials through landscape management and by limiting the use of pesticides, through the combination of species/varieties and through limiting field size							
	<i>Landscape management (hedges, grass strips etc.)</i>							
	Creation of push/pull zones							
	Creation of trap crops							
	Shifting sowing date							
Limit periods when plant is in contact with pest	Limit contact surface between target crop and pest	Adjustment of nitrogen inputs to the production needs of the crop to limit over-development of foliar surfaces						
		Reduction of sowing density						
Boost resistance of canopy to pests	Boost tolerance of canopy to pests	Combination of species and varieties						
		Choice of resistant varieties						
Limit crop loss	Have a crop with low susceptibility to pests	Choice of tolerant varieties						
		Assure a good level of nitrogen nutrition so the plant is more vigorous						
		Shifting sowing date						

In italics, protection methods working at scales other than the field scale.
